

Préparation entretiens Cirruseo

Échange en anglais :

LUI:

Hello how are you?

Could you tell me a little bit about yourself, your background?

MOI:

Yes of course.

So, I am a young web developer, although I am not young in the world of work.

Indeed I started working more than 20 years ago in restoration. I have evolved over the years and I have quickly progressed to the position of manager where I stayed several years.

A health problem in two thousand seven forced me to change jobs.

LUI:

Oh yes and what kind of health problem without wanting to be indiscreet

MOI:

An ulcer that showed me that my commitment to my job was poorly gauged

I was young in the two thousand years and the professional constraint related to the Parisian life of a young man was right of my stomach !

My second profession was store management, I had the opportunity to manage large teams and stores with turnover of several million euros per year. It was a very interesting experience.

I exercise at this position for 5 years

But to work for this company you must be married, my divorce ended this career.

So I went down to Toulouse to find a party of my family and I went back to restoration as a manager for Accor group.

But this life was no longer mine and it was at this time that I discovered Unity and Blender and therefore my first line of code to entertain me.

Some simple games develop in C # and some quick modeling in python and I had just discovered what could be my last professional path.

2 years later I received an invitation to participate in the formation of the wild code School.

And here I am!

LUI:

ok ok and could you introduce me to one of your school project in a few minutes

MOI:

A porjet of the wild ..

My last personal project took over all the technical aspects of the professional project that we had done in team to close the formation of the wild code school.

I called him Re-visit your cards an application that generates a random buisness cards

Two major part, a back and a front.

A back with several classic roads, a login a register and a porfil

These roads being intended for the most part retrieved data from the front for the database or vice versa.

he encrypted the passwords and compared them.

It also sends any confirmation or error message to the front as a small pop-up window

the Front was a simple user interface, after being registered one connects some information and an image or a logo to generate random business cards.

LUI :

ok thank you, so I took note of all this and I will contact you soon to give you our answer about our interviews
